Excel Functions Test - Interview Summary

1. AVERAGE

What I did: Calculated averages using AVERAGE because it is dynamic and reliable.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

2. Filter

What I did: Used AutoFilter to show only required records without modifying data.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

3. Concatenation

What I did: Combined text fields using & for clean text transformation.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

4. COUNTIF

What I did: Detected duplicate values for data quality validation.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

5. PivotTable

What I did: Summarized data efficiently for reporting.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

6. IF

What I did: Applied conditional business logic for loan calculations.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

7. RIGHT/LEN/FIND

What I did: Extracted characters dynamically after X.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

8. VLOOKUP

What I did: Retrieved related information automatically from lookup tables.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

9. UNIQUE + AVERAGEIF

What I did: Created dynamic unique lists with calculated averages.

Why: This approach is scalable, dynamic, reduces manual work, and follows Excel best practices expected from a Data Analyst.

Conclusion

These tasks demonstrate data transformation, cleaning, validation, summarization, lookup techniques, and business logic implementation. Together they reflect core Excel skills used in ETL processes and business reporting.
